

# Package ‘kstMatrix’

September 1, 2026

**Type** Package

**Date** 2026-09-01

**Version** 3.0-0

**Title** Basic Functions in Knowledge Space Theory Using Matrix Representation

**Description** Knowledge space theory by Doignon and Falmagne (1999)  [<doi:10.1007/978-3-642-58625-5>](https://doi.org/10.1007/978-3-642-58625-5) is a set- and order-theoretical framework, which proposes mathematical formalisms to operationalize knowledge structures in a particular domain. The 'kstMatrix' package provides basic functionalities to generate, handle, and manipulate knowledge structures and knowledge spaces. Opposed to the 'kst' package, 'kstMatrix' uses matrix representations for knowledge structures. Furthermore, 'kstMatrix' contains several knowledge spaces obtained in the 1990s by the research group around Cornelia Dowling through querying experts.

**Depends** R (>= 4.4.0)

**Imports** stats, grDevices, sets, pks, tidyr, DiagrammeR, rsvg

**Suggests** DiagrammeRsvg, knitr, markdown, Rgraphviz

**Maintainer** Cord Hockemeyer <cord.hockemeyer@uni-graz.at>

**License** GPL-3

**NeedsCompilation** yes

**Repository** CRAN

**Encoding** UTF-8

**LazyData** true

**VignetteBuilder** knitr

**Config/roxygen2/version** 8.1.0

**Author** Cord Hockemeyer [aut, cre],  
Peter Steiner [aut],  
Wai Wong [aut]

**Date/Publication** 2026-09-01 16:10:02 UTC

binary\_matrix\_product

Compute a binary matrix product

---

**Description**

binary\_matrix\_product expects two binary matrices and computes their Boolean product.

**Usage**

binary\_matrix\_product(m, n)

**Arguments**

- m                    Binary matrix
- n                    Binary matrix

**Value**

Boolean matrix product of m and n

**See Also**

Other Utilities: [kmdoubleequal\(\)](#), [kmminimalfamset\(\)](#), [kmsetiselement\(\)](#), [kmsymmsetdiff\(\)](#), [kmtrivial](#)

**Examples**

```
binary_matrix_product(xpl$sr, kmsurmiserelation(kmmaximalspace(4)))
binary_matrix_product(xpl$sr, kmsurmiserelation(kmminimalspace(4)))
```

cad

*Knowledge spaces on AutoCAD knowledge***Description**

Bases of knowledge spaces on AutoCAD knowledge obtained from querying experts.

**Usage**

cad

**Format**

A list containing seven bases (cad1 to cad6, and cadmaj) in binary matrix form. Each matrix has 28 columns representing the different knowledge items and a varying number of rows containing the basis elements.

**Details**

Six experts were queried about prerequisite relationships between 28 AutoCAD knowledge items (Dowling, 1991; 1993). A seventh basis represents those prerequisite relationships on which the majority (4 out of 6) of the experts agree (Dowling & Hockemeyer, 1998).

fractions

*Knowledge spaces on fractions***Description**

Bases of knowledge spaces on fractions obtained from querying experts.

**Usage**

fractions

## Format

A list containing four bases (frac1 to frac3, and fracmaj) in binary matrix form. Each matrix has 77 columns representing the different knowledge items and a varying number of rows containing the basis elements.

## Details

Three experts were queried about prerequisite relationships between 77 items on fractions (Baumunk & Dowling, 1997). A forth basis represents those prerequisite relationships on which the majority of the experts agree (Dowling & Hockemeyer, 1998).

---

kmassess

---

*Perform a probabilistic knowledge assessment*

---

## Description

kmassess performs a probabilistic knowledge assessment for a given response vector, knowledge structure, and BLIM parameters.

kmsassess performs a simplified probabilistic knowledge assessment for a given response vector, knowledge structure, and BLIM parameters. It assumes an equal probability distribution over the knowledge structure as starting point and identical beta and eta values for all items.

## Usage

```
kmassess(
  r,
  pks,
  questioning,
  update,
  beta,
  eta,
  zeta0,
  zeta1,
  threshold,
  probdev = FALSE,
  directory = tempdir()
)
```

```

kmassess(
  r,
  ks,
  questioning,
  update,
  beta,
  eta,
  zeta0,
  zeta1,
  threshold,
  probdev = FALSE,
  directory = NULL
)

```

### Arguments

|                          |                                                                                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>r</code>           | Response pattern (binary vector)                                                                                                                         |
| <code>pks</code>         | Probabilistic knowledge structure: a data frame with a probability distribution in the first columns and the structure matrix in the subsequent columns. |
| <code>questioning</code> | Questioning rule ("halfsplit" or "informative")                                                                                                          |
| <code>update</code>      | Update rule ("Bayesian" or "multiplicative")                                                                                                             |
| <code>beta</code>        | Careless error probability                                                                                                                               |
| <code>eta</code>         | Lucky guess probability                                                                                                                                  |
| <code>zeta0</code>       | Update parameter for wrong responses                                                                                                                     |
| <code>zeta1</code>       | Update parameter for correct responses                                                                                                                   |
| <code>threshold</code>   | Probability threshold for stopping criterion                                                                                                             |
| <code>probdev</code>     | Provide information on the probability development including Hasse diagrams stored in <code>tempdir()</code> . Defaults to FALSE.                        |
| <code>directory</code>   | Where to store the Hasse diagrams.                                                                                                                       |
| <code>ks</code>          | Knowledge structure: a binary matrix                                                                                                                     |

### Details

`kmassess` implements the stochastic assessment procedures according to Doignon & Falmagne, 1999, chapter 10.

`kmassess` stops if the number of questions has reached twice the number of items.

### Value

A list with the following elements:

**state** Diagnosed knowledge state (binary vector)

**probs** Resulting probability distribution. If `probdev` is set to TRUE, a list of probability distributions for each step is given instead.

**queried** Sequence of items used in the assessment (list)

**qtime** Average time for finding a question

**utime** Average time for updating the probabilities

A list with the following elements:

**state** Diagnosed knowledge state (binary vector)

**probs** Resulting probability distribution. If `probdev` is set to `TRUE`, a list of probability distributions for each step is given instead.

**queried** Sequence of items used in the assessment (list)

**qtime** Average time for finding a question

**utime** Average time for updating the probabilities

## Background

Doignon & Falmagne (1985, 1999) proposed knowledge space theory originally with adaptive knowledge assessment in mind. The basic idea is to apply prerequisite relationships between items for reducing the number of problems to be posed to a learner in knowledge assessment.

Falmagne & Doignon (1988; Doignon & Falmagne, 1999, chapitre 10) proposed a class of stochastic procedures for such adaptive assessment which take into account that careless errors and lucky guesses may happen during the assessment by estimating a probability distribution over the knowledge structure. Such an assessment consists of three important parts

- Question rule
- Update rule
- Stopping criterion

For the **question rule**, they propose the *halfsplit* and the *informative* rules, implemented in `kmassesshalfsplit` and `kmassessinformative`.

For the **update rule**, they again propose two possibilities there the *multiplicative rule* is a generalisation of the (classical) *Bayesian update rule* implemented here in `kmassessmultiplicative` and `kmassessbayesian`, respectively.

As **stopping criterion**, usually a threshold for the maximal probability for one knowledge state is used. It is strongly recommended to keep this larger than 0.5 in order to have one unequivocal resulting state (see also Hockemeyer, 2002).

### Framework of assessment functions within the `kstMatrix` package::

The founding stones are the four aforementioned functions for finding suitable questions and for updating the probability estimates, respectively. They could also be used in an interactive system, e.g. a Shiny app, for "real" adaptive assessment.

The remaining three assessment functions serve for mere simulation of adaptive assessment. `kmassess` takes, among others, a full response pattern as parameter and takes the responses for the selected questions from this vector. `kmsassess` is a simplified version where the update parameters (beta and eta for Bayesian or zeta0 and zeta1 for multiplicative update, respectively) are identical for all items whereas they are item-specific in `kmassess`. Finally, `kmassesssimulation` takes a whole data set, i.e. a collection of response patterns, and does an assessment for each of these patterns. Its result is a data frame which should be suitable for further statistical evaluation,

especially if it is called several times with variant parameters (e.g., structures, update parameters, update and question rules).

Both, kmsassess and kmassesssimulation call kmassess.

### Problems:

In rare cases kmassess may flip forth and back between probability distributions resulting in an endless loop. Therefore, it stops after twice the number of items delivering a NULL result.

```

---

kmassessbayesian

*Update probability distribution applying Bayesian update*

---

## Description

kmassessbayesian updates a probability distribution over a knowledge structure according to the Bayesian update rule.

**Usage**

```
kmassessbayesian(probs, ks, beta, eta, question, response)
```

**Arguments**

|          |                                                                |
|----------|----------------------------------------------------------------|
| probs    | Probability distribution over the knowledge structure (vector) |
| ks       | Binary matrix of the knowledge structure                       |
| beta     | Vector of careless error probabilities                         |
| eta      | Vector of lucky guess probabilities                            |
| question | Item that has been posed                                       |
| response | Correctness of received response (0 or 1)                      |

**Value**

Updated probability vector

  NULL
)
```

---

kmassessmentsimulation

*Simulate assessments for a set of response patterns*

---

**Description**

kmassessmentsimulation does a probabilistic knowledge assessment for each response pattern in a data matrix and stores information about the assessment.

**Usage**

```
kmassessmentsimulation(
  respdata,
  ks,
  questioning,
  update,
  beta,
  eta,
  zeta0,
  zeta1,
  threshold
)
```

**Arguments**

|             |                            |
|-------------|----------------------------|
| respdata    | Data matrix                |
| ks          | Knowledge structure        |
| questioning | Question rule              |
| update      | Updating rule              |
| beta        | Careless error probability |

|           |                                        |
|-----------|----------------------------------------|
| eta       | Lucky guess probability                |
| zeta0     | Update parameter for wrong responses   |
| zeta1     | Update parameter for correct responses |
| threshold | Stopping criterion                     |

### Details

kmassessmentssimulation applies the kmsassess function.

### Value

Assessment data as data frame

### See Also

Other Knowledge assessment functions: [kmassess\(\)](#), [kmassessbayesian\(\)](#), [kmassesshalfsplit\(\)](#), [kmassessinformativ\(\)](#), [kmassessmultiplicative\(\)](#)

### Examples

```
kmassessmentssimulation(
  xpl$data,
  xpl$space,
  "halfsplit",
  "multiplicative",
  NULL,
  NULL,
  5,
  5,
  0.55
)
```

---

kmassessmultiplicative

*Update probability distribution applying multiplicative rule*

---

### Description

kmassessmultiplicative updates a probability distribution on a knowledge structure according to the multiplicative rule.

### Usage

```
kmassessmultiplicative(probs, ks, zeta0, zeta1, question, response)
```

**Arguments**

|          |                                                                |
|----------|----------------------------------------------------------------|
| probs    | Probability distribution over the knowledge structure (vector) |
| ks       | Binary matrix of the knowledge structure                       |
| zeta0    | Vector of update parameters for wrong responses                |
| zeta1    | Vector of update parameters for correct responses              |
| question | Item that has been posed                                       |
| response | Correctness of received response (0 or 1)                      |

**Value**

Updated probability vector

**See Also**

Other Knowledge assessment functions: [kmassess\(\)](#), [kmassessbayesian\(\)](#), [kmassesshalfsplit\(\)](#), [kmassessinformativ\(\)](#), [kmassessmentsimulation\(\)](#)

**Examples**

```
kmassessmultiplicative(c(0.02, 0.1, 0.07, 0.01, 0.4, 0.17, 0.07, 0.08, 0.08),
  xpl$space,
  rep(1.2,4),
  rep(2.1,4),
  3,
  1
)
```

---

kmbasis

---

*Compute the basis of a knowledge space*

---

**Description**

`kmbasis.kmsurmisefunction` takes a surmise function and returns the corresponding basis, i.e. effectively the collection of all clauses in the surmise function.

`kmbasis.kmsurmiserelation` takes a surmise relation and returns the corresponding basis.

`kmbasis.matrix` returns a matrix representing the basis of a knowledge space. If `x` is a knowledge structure or an arbitrary family of sets `kmbasis` returns the basis of the smallest knowledge space containing `x`.

**Usage**

```
kmbasis(x)

## S3 method for class 'kmsurmisefunction'
kmbasis(x)

## S3 method for class 'kmsurmiserection'
kmbasis(x)

## S3 method for class 'matrix'
kmbasis(x)
```

**Arguments**

x                      Binary matrix representing a knowledge space

**Value**

Binary matrix representing the basis of the corresponding knowledge space.

**See Also**

Other Different representations for knowledge structures: [kmspace\(\)](#), [kmsurmisefunction\(\)](#), [kmsurmiserection\(\)](#)

**Examples**

```
kmbasis(xpl$sf)

kmbasis(xpl$sr)

kmbasis(xpl$space)
```

---

|                |                                                                           |
|----------------|---------------------------------------------------------------------------|
| kmbasisdiagram | <i>DEPRECATED: kmbasisdiagram() has been replaced by a plot() method.</i> |
|----------------|---------------------------------------------------------------------------|

---

**Description**

DEPRECATED: kmbasisdiagram() has been replaced by a plot() method.

**Usage**

```
kmbasisdiagram(x, horizontal = TRUE, colors = NULL)
```

**Arguments**

|            |                                                                                       |
|------------|---------------------------------------------------------------------------------------|
| x          | Basis                                                                                 |
| horizontal | Boolean whether the diagram should be drawn horizontally or vertically (default TRUE) |
| colors     | Color vector (default NULL)                                                           |

|---------------|-----------------------------------------------------------------------------------|
| kmbasisfringe | <i>Compute the fringe of a state within a knowledge structure using its basis</i> |
|---------------|-----------------------------------------------------------------------------------|

---

**Description**

kmbasisfringe computes the fringe of a state within a knowledge structure, i.e. the set of items by which the state differs from its neighbours.

**Usage**

```
kmbasisfringe(state, basis)
```

```
kmbasisinnerfringe(state, basis)
```

```
kmbasisouterfringe(state, basis)
```

**Arguments**

|       |                                              |
|-------|----------------------------------------------|
| state | Binary vector representing a knowledge state |
| basis | kmbasis object                               |

**Value**

Binary vector representing the fringe

```

---

|                      |                                                                                          |
|----------------------|------------------------------------------------------------------------------------------|
| kmbasisneighbourhood | <i>Compute the neighbourhood of a state within a knowledge structure using its basis</i> |
|----------------------|------------------------------------------------------------------------------------------|

---

### Description

kmbasisneighbourhood computes the neighbourhood of a state within a knowledge structure, i.e. the family of all other states with a symmetric set difference of 1.

### Usage

```
kmbasisneighbourhood(state, basis, include = FALSE)
```

### Arguments

|         |                                                                                     |
|---------|-------------------------------------------------------------------------------------|
| state   | Binary vector representing a knowledge state                                        |
| basis   | kmbasis object                                                                      |
| include | Boolean whether the original state should be included in the result (default FALSE) |

### Value

Matrix containing the neighbouring states, one per row

### See Also

Other Functions for fringes & neighbourhoods: [kmbasisfringe\(\)](#), [kmfringe\(\)](#), [kmneighbourhood\(\)](#)

### Examples

```
kmbasisneighbourhood(c(1,1,0,0), xpl$basis)
```

|           |                                             |
|-----------|---------------------------------------------|
| kmclosure | <i>Determine the closure of KST objects</i> |
|-----------|---------------------------------------------|

---

### Description

kmclosure() is an S3 method closing kstMatrix objects.

**Usage**

```

kmclosure(x, ...)

## S3 method for class 'kmattributionfunction'
kmclosure(x, ...)

## S3 method for class 'kmattributionrelation'
kmclosure(x, ...)

## S3 method for class 'kmdata'
kmclosure(x, ...)

## S3 method for class 'kmfamset'
kmclosure(x, ..., closure = "union")

```

**Arguments**

|         |                                                                                                                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x       | KST object                                                                                                                                                                                                                                                                                                   |
| ...     | Optional additional parameters                                                                                                                                                                                                                                                                               |
| closure | Type of closure<br>For families of sets (kmfamset), kmclosure is basically a wrapper for kmunionclosure() and kmintersectionclosure. closure() may take the values "union" (default) or "intersection". The former requests a closure under union, the latter a closure under union <b>and</b> intersection. |

**Value**

Corresponding closed KST object

An attribution relation or attribution function is closed to the corresponding surmise relation or surmise function, respectively.

A family of sets (including bases, knowledge structure, and knowledge space) is closed to a knowledge space or quasi-ordinal knowledge space.

**See Also**

Other Closure operators: [kmintersectionclosure\(\)](#), [kmunionclosure\(\)](#)

---

kmcolors

*Determine a color vector based on probabilities*

---

**Description**

kmcolors takes a probability vector and a color palette and creates a color vector to be used with `kstMatrix::plot`.

**Usage**

```
kmcolors(prob, palette = cm.colors)
```

**Arguments**

|         |                                     |
|---------|-------------------------------------|
| prob    | Probability vector                  |
| palette | Color palette (default = cm.colors) |

|        |                                                                          |
|--------|--------------------------------------------------------------------------|
| kmdist | <i>Compute the distance between a data set and a knowledge structure</i> |
|--------|--------------------------------------------------------------------------|

---

**Description**

kmdist returns a named vector with the frequencies of distances between a set of response patterns and a knowledge structure. This vector can be used to compute, e.g., the Discrepancy Index (DI) or the Distance Agreement Coefficient (DA).

**Usage**

```
kmdist(data, struct)
```

**Arguments**

|        |                                                       |
|--------|-------------------------------------------------------|
| data   | Binary matrix representing a set of response patterns |
| struct | Binary matrix representing a knowledge structure      |

**Value**

Distance distribution vector

```

---

|               |                                                                   |
|---------------|-------------------------------------------------------------------|
| kmdoubleequal | <i>Test two double numbers on equity with a certain tolerance</i> |
|---------------|-------------------------------------------------------------------|

---

**Description**

Test two double numbers on equity with a certain tolerance

**Usage**

```
kmdoubleequal(x, y, tol = sqrt(.Machine$double.eps))
```

**Arguments**

|     |                          |
|-----|--------------------------|
| x   | First double to compare  |
| y   | Second double to compare |
| tol | Tolerance optional)      |

**Value**

Boolean for (approximate) equity

**See Also**

0.5 + 0.5 == 1
```

---

|               |                                                                             |
|---------------|-----------------------------------------------------------------------------|
| kmeqreduction | <i>Reduce a family of knowledge states with respect to item equivalence</i> |
|---------------|-----------------------------------------------------------------------------|

---

**Description**

kmeqreduction takes a family of knowledge states and returns its reduction to non-equivalent items.

**Usage**

```
kmeqreduction(x)
```

**Arguments**

x                      Family of sets (kmfamset object)

**Value**

Binary matrix reduced by equivalences

**See Also**

Other Functions for working with knowledge structures: [kmexpand\(\)](#), [kmintersection\(\)](#), [kmmesh\(\)](#), [kmotions\(\)](#), [kmsubstructure\(\)](#), [kmtrivial](#), [kmunion\(\)](#)

```

---

|          |                                                                                                   |
|----------|---------------------------------------------------------------------------------------------------|
| kmexpand | <i>Expand an attribution function to a larger set of items and close it to a surmise function</i> |
|----------|---------------------------------------------------------------------------------------------------|

---

**Description**

kmexpand() expands an attribution function by additional items and closes it to a surmise function.

**Usage**

```
kmexpand(af, ni)
```

**Arguments**

af                      Attribution function  
ni                      New (complete) item list

**Value**

Expanded surmise function

**See Also**

Other Functions for working with knowledge structures: [kmegreduction\(\)](#), [kmintersection\(\)](#), [kmmesh\(\)](#), [kmotions\(\)](#), [kmsubstructure\(\)](#), [kmtrivial](#), [kmunion\(\)](#)

kmexpand(xpl$sf, c("a", "b", "c", "d", "e", "f"))
```

---

|          |                                                                      |
|----------|----------------------------------------------------------------------|
| kmfamset | <i>Convert a binary matrix to a kmfamset object (family of sets)</i> |
|----------|----------------------------------------------------------------------|

---

**Description**

kmfamset returns a kmfamset object after checking that the passed object is a binary matrix with all different rows. If the passed object inherits the kmfamset property, nothing else is changed.

**Usage**

```
kmfamset(x)
```

**Arguments**

x                      Binary matrix representing a family of sets

**Value**

kmfamset object

**See Also**

Other Constructors: [kmqspace\(\)](#), [kmspace\(\)](#), [kmstructure\(\)](#)

**Examples**

```
m <- as.matrix(c(1,0,0,0,1,0,1,1,1), nrow=3, byrow=TRUE)
kmfamset(m)
```

---

|          |                                                                   |
|----------|-------------------------------------------------------------------|
| kmfringe | <i>Compute the fringe of a state within a knowledge structure</i> |
|----------|-------------------------------------------------------------------|

---

**Description**

kmfringe computes the fringe of a state within a knowledge structure, i.e. the set of items by which the state differs from its neighbours.

**Usage**

```
kmfringe(state, struct)
```

```
kminnerfringe(state, struct)
```

```
kmouterfringe(state, struct)
```

**Arguments**

|        |                                                  |
|--------|--------------------------------------------------|
| state  | Binary vector representing a knowledge state     |
| struct | Binary matrix representing a knowledge structure |

**Value**

Binary vector representing the fringe

**See Also**

**Examples**

```
kmfringe(c(1,0,0,0), xpl$space)
```

---

kmgenerate

---

*Generate a knowledge structure from a set of response patterns*

---

**Description**

kmgenerate returns a matrix representing a knowledge structure generated from data. It uses a simplistic approach: patterns with a frequency above a specified threshold are considered as knowledge states. If the specified threshold is 0 (default) a real threshold is computed as  $N$  (number of response patterns) divided by  $2^{|Q|}$ . Please note that the number of response patterns should be much higher than the size of the power set of the item set  $Q$ . A factor of at least 10 is recommended. Currently, the number of items is limited to the number of bits in a C long minus one (i.e. 31 under Windows and 63 otherwise). But we would probably run into memory problems way earlier anyway.

**Usage**

```
kmgenerate(x, threshold = 0)
```

**Arguments**

|           |                                                                        |
|-----------|------------------------------------------------------------------------|
| x         | Binary matrix representing a data set                                  |
| threshold | Threshold for taking response patterns as knowledge states (default 0) |

**Value**

Binary matrix representing the generated knowledge structure

**See Also**

Other Functions for working with data: [kmSRvalidate\(\)](#), [kmdist\(\)](#), [kmiita2SR\(\)](#), [kmsimulate\(\)](#), [kmvalidate\(\)](#)

```

---

|              |                                                    |
|--------------|----------------------------------------------------|
| kmgradations | <i>Determine all gradations between two states</i> |
|--------------|----------------------------------------------------|

---

**Description**

Determine all gradations between two states

**Usage**

```
kmgradations(structure, from = NULL, to = NULL)
```

**Arguments**

|           |                                                         |
|-----------|---------------------------------------------------------|
| structure | Knowledge structure                                     |
| from      | Starting state (if NULL (default), it is the empty set) |
| to        | Goal state (if NULL (default), it is the full item set) |

**Value**

A list of gradations where each gradation is a list of states

**See Also**

Other Functions for wellgradedness & learning paths: [kmiswellgraded\(\)](#), [kmlearningpathmatrices\(\)](#), [kmlearningpaths\(\)](#)

**Examples**

---

|           |                                                                                      |
|-----------|--------------------------------------------------------------------------------------|
| kmheights | <i>Compute the heights of items in a knowledge space specified through its basis</i> |
|-----------|--------------------------------------------------------------------------------------|

---

**Description**

The height of an item in the knowledge space is defined as the minimal cardinality of the states containing it minus 1, i.e. the minimal number of prerequisites.

**Usage**

```
kmheights(b)
```

**Arguments**

|   |       |
|---|-------|
| b | Basis |
|---|-------|

**Value**

Data.frame with a table of heights.

**See Also**

Other Properties of knowledge structures: [kmiswellgraded\(\)](#), [kmnotions\(\)](#)

## Examples

```
kmheights(xpl$basis)
```

---

**kmiita2SR***Convert an IITA result into a surmise relation matrix*

---

## Description

kmiita2SR takes the result of a `DAKS::iita()` call and delivers the matrix of the computed surmise relation.

## Usage

```
kmiita2SR(ii, names = NULL, items = 0)
```

## Arguments

|                    |                                                   |
|--------------------|---------------------------------------------------|
| <code>ii</code>    | <code>iita()</code> result                        |
| <code>names</code> | Vector of item names (default <code>NULL</code> ) |
| <code>items</code> | Minimal number of items (default 0)               |

## Value

Surmise relation matrix

The `iita()` function loses information on the item names and uses consecutive numbers instead. The implications part of its result does not give any hint on isolated items, i.e. items which neither have a prerequisite nor are prerequisite of any other item. Therefore, a minimal number of items can be passed to `kmiita2SR()`. If the highest item number within implications is higher, this `items` parameter is ignored.

---

|                |                                                      |
|----------------|------------------------------------------------------|
| kmintersection | <i>Compute the "intersection" of two KST objects</i> |
|----------------|------------------------------------------------------|

---

### Description

Both objects must be of the same kstMatrix class, the result will be of the same class, i.e. a respective closure operator will be executed automatically.

Please note that the intersection of surmise relations is automatically a surmise relation without any closure needs.

### Usage

```
kmintersection(x, y)

## S3 method for class 'kmgospace'
kmintersection(x, y)

## S3 method for class 'kmspace'
kmintersection(x, y)

## S3 method for class 'kmsurmisefunction'
kmintersection(x, y)

## S3 method for class 'kmsurmiserelation'
kmintersection(x, y)
```

### Arguments

|   |                   |
|---|-------------------|
| x | First KST object  |
| y | Second KST object |

### Value

*Intersection of x and y*

```

---

kmiswellgraded            *Check for wellgradedness of a knowledge structure*

---

**Description**

kmiswellgraded() returns whether a knowledge space (or its basis) is well-graded.

**Usage**

```
kmiswellgraded(x)
```

**Arguments**

x                      kmspace or kmbasis

**Value**

Logical value specifying whether x is well-graded

*Determine all learning paths in a knowledge structure*

---

## Description

Determine all learning paths in a knowledge structure

## Usage

```
kmlearningpathmatrices(structure, through = NULL, from = NULL, to = NULL)
```

## Arguments

|           |                                                   |
|-----------|---------------------------------------------------|
| structure | Knowledge structure                               |
| through   | Knowledge state through which the paths should go |
| from      | Knowledge state where paths should start          |
| to        | Knowledge state where paths should end            |

## Value

A list of learning paths where each learning path matrix

If through is specified, only those learning paths are listed which go through that state (binary vector). If from and to are specified, the respective sub paths are returned.

## See Also

|                 |                                                            |
|-----------------|------------------------------------------------------------|
| kmminimalfamset | <i>Determine subfamily of minimal states in a kmfamset</i> |
|-----------------|------------------------------------------------------------|

---

**Description**

Determine subfamily of minimal states in a kmfamset

**Usage**

```
kmminimalfamset(x)
```

**Arguments**

|   |          |
|---|----------|
| x | kmfamset |
|---|----------|

**Value**

kmfamset of minimal states

kmminimalfamset() determines the sub family of minimal sets within a famset. If x is a knowledge structure, the result will be a family containing (only) the empty set because the empty set is a state in any knowledge structure and is its minimal state.

The concept of the minimal state of a family of sets should not be confused with the concept of knowledge states minimal for some item.

**Examples**

```
m <- matrix(c(1,0,0,0,1,0,1,0,1), ncol=3, byrow=TRUE)
m
kmminimalfamset(kmfamset(m))
```

---

kmneighbourhood

---

*Compute the neighbourhood of a state within a knowledge structure*

---

**Description**

kmneighbourhood computes the neighbourhood of a state within a knowledge structure, i.e. the family of all other states with a symmetric set difference of 1.

kmnneighbourhood computes the n-neighbourhood of a state within a knowledge structure, i.e. the family of all other states with a symmetric set difference maximal n.

**Usage**

```
kmneighbourhood(state, struct, include = FALSE)
```

```
kmnneighbourhood(state, struct, distance, include = FALSE)
```

**Arguments**

|          |                                                                       |
|----------|-----------------------------------------------------------------------|
| state    | Binary vector representing a knowledge state                          |
| struct   | Binary matrix representing a knowledge structure                      |
| include  | Boolean whether the original state should be included (default FALSE) |
| distance | Size of the n-neighbourhood                                           |

**Value**

Matrix containing the neighbouring states, one per row

Matrix containing the neighbouring states, one per row

```
kmneighbourhood(c(1,1,0,0), xpl$space)
```

```
kmnneighbourhood(c(1,1,0,0), xpl$space, 2)
```

---

kmnotions

*Determine the notions of a knowledge structure*

---

**Description**

kmnotions returns a matrix representing the notions of a knowledge structure.

**Usage**

```
kmnotions(x)
```

**Arguments**

x                      Binary matrix representing a knowledge structure

**Value**

Binary matrix representing notions in the knowledge structure

The matrix has a '1' in row 'i' and column 'j' if 'i' and 'j' belong to the same notion (i.e. are equivalent). It is a symmetric matrix with '1's in the main diagonal.

kmnotions(xpl$space)
```

---

|               |                                          |
|---------------|------------------------------------------|
| kmprettyprint | <i>Print KST objects in set notation</i> |
|---------------|------------------------------------------|

---

## Description

kmprettyprint() formats KST objects in set notation for printing. For further details, see below.

## Usage

```
kmprettyprint(
  x,
  simplified = FALSE,
  ...,
  open = "{",
  close = "}",
  inneropen = "{",
  innerclose = "}"
)

## S3 method for class 'numeric'
kmprettyprint(
  x,
  simplified = FALSE,
  ...,
  open = "{",
  close = "}",
  itemsep = ", "
)

## S3 method for class 'kmfamset'
kmprettyprint(
  x,
  simplified = FALSE,
  ...,
  open = "{",
  close = "}",
  inneropen = "{",
  innerclose = "}"
)

## S3 method for class 'kmattributionfunction'
kmprettyprint(
  x,
  simplified = FALSE,
  ...,
  open = "[",
  close = "]",

```

```
        inneropen = "{",
        innerclose = "}",
        mapsto = NULL
    )

## S3 method for class 'kmattributionrelation'
kmprettyprint(
    x,
    simplified = FALSE,
    ...,
    open = "{",
    close = "}",
    inneropen = "(",
    innerclose = ")",
    tuple = TRUE,
    relation = NULL
)

## S3 method for class 'kmdata'
kmprettyprint(
    x,
    simplified = FALSE,
    ...,
    open = "(",
    close = ")",
    inneropen = "{",
    innerclose = "}"
)

## S3 method for class 'kmlearningpathlist'
kmprettyprint(
    x,
    simplified = FALSE,
    ...,
    open = "",
    close = "",
    inneropen = "{",
    innerclose = "}",
    path = NULL
)

## S3 method for class 'kmlearningpathmatrices'
kmprettyprint(
    x,
    simplified = FALSE,
    ...,
    open = "",
    close = "",
```

```

    inneropen = "{",
    innerclose = "}",
    path = NULL
)

## S3 method for class 'kmlearningpathmatrix'
kmprettyprint(
  x,
  simplified = FALSE,
  ...,
  open = "",
  close = "",
  inneropen = "{",
  innerclose = "}",
  path = NULL
)

```

### Arguments

|                         |                                                                                    |
|-------------------------|------------------------------------------------------------------------------------|
| <code>x</code>          | Object to be printed                                                               |
| <code>simplified</code> | Omit inner braces for families of sets (default FALSE)                             |
| <code>...</code>        | Optional further arguments                                                         |
| <code>open</code>       | (Outer) opening bracket                                                            |
| <code>close</code>      | (Outer) closing bracket                                                            |
| <code>inneropen</code>  | Inner opening bracket                                                              |
| <code>innerclose</code> | Inner closing bracket                                                              |
| <code>itemsep</code>    | Item separating character string                                                   |
| <code>mapsto</code>     | Mapsto symbol for pretty-printing surmise and attribution functions (Default: '↦') |
| <code>tuple</code>      | Should we use tuple notation (default TRUE)?                                       |
| <code>relation</code>   | Relation symbol for pretty-printing surmise and attribution relations              |
| <code>path</code>       | Rightarrow for pretty-printing path (Default: '→')                                 |

### Details

If `simplified` is TRUE, a state '`{a, b, c}`' is printed as '`abc`'. This should only be used if the item names are single letters.

For Families of sets (`kmfamset` and sub classes), the states are ordered by cardinality.

`inneropen` and `innerclose` are ignored for numeric vectors (i.e. states/plain sets).

`mapsto` defines the '`mapsto`' symbol for pretty-printing a surmise or attribution function. It may contain more than one character, as in the default.

For surmise and attribution relations, there are two special parameters. `tuple` sets whether the relation shall be printed as set of ordered pairs or whether it shall be printed as tuple of pairs with relation symbol which can be set with the `relation` parameter.

For `kmlearningpaths` lists, the result should be printed through `cat()` instead of `print()` because the latter does not execute the line breaks.

Please note that the methods can also be used for sub classes, e.g. the `kmprettyprinting.kmfamset()` method is also applicable for bases, knowledge structures, and knowledge spaces.

`kmprettyprint()` was decidedly not implemented as `print()` method. This way, one can *print* KST objects in matrix or data frame notation or *prettyprint* them in set notation etc.

### See Also

### Examples

```
kmprettyprint(xpl$basis)
kmprettyprint(xpl$basis, simplified=TRUE)
kmprettyprint(xpl$sr)
kmprettyprint(xpl$sf)
```

---

kmqspace

---

*Obtain a quasi-ordinal knowledge space*

---

### Description

`kmqspace()` computes the quasi-ordinal space corresponding to a given KST object.

`kmqspace()` computes the smallest quasi-ordinal space containing a given family of sets.

`kmqspace.kmsurmisefunction()` takes a surmise function and determines the quasi-ordinal knowledge space which is the closure under intersection of the knowledge space delineated by this surmise function.

`kmqspace.kmsurmisere relation()` computes the quasi-ordinal knowledge space delineated by a surmise relation

### Usage

```
kmqspace(x)

## S3 method for class 'kmfamset'
kmqspace(x)

## S3 method for class 'kmsurmisefunction'
kmqspace(x)

## S3 method for class 'kmsurmisere relation'
kmqspace(x)
```

**Arguments**

x                      KST object

**Value**

Corresponding kmqspace object

**See Also**

kmqspace(m)

m <- kmfamset(matrix(c(1,0,0,0,1,0,1,1,1), nrow=3, byrow=TRUE))
kmqspace(m)

sr <- kmsurmiserelement(xpl$space)
kmqspace(sr)
```

---

kmrefine

---

*Refine a famset by dissolving a notion through a basis on the notion*

---

**Description**

Refine a famset by dissolving a notion through a basis on the notion

**Usage**

```
kmrefine(x, b)
```

**Arguments**

x                      Family of sets  
b                      Basis for refinement

**Value**

Refined family of sets

**Examples**

```
x <- kmfamset(matrix(c(1,0,0,0,0,1,0,0,1,1,1,1), ncol=4, byrow=TRUE))
colnames(x) <- c("a", "b", "c", "d")
x
b <- kmbasis(kmfamset(matrix(c(1,0,1,1), ncol=2, byrow=TRUE)))
colnames(b) <- c("c", "d")
b
kmrefine(x,b)
```

---

|                |                                                           |
|----------------|-----------------------------------------------------------|
| kmsetiselement | <i>Test if a state is contained in a family of states</i> |
|----------------|-----------------------------------------------------------|

---

**Description**

Test if a state is contained in a family of states

**Usage**

```
kmsetiselement(s, f)
```

**Arguments**

|   |                |
|---|----------------|
| s | State          |
| f | Family of sets |

**Value**

Boolean is s is contained in f

**See Also**

Other Utilities: [binary\\_matrix\\_product\(\)](#), [kmdoubleequal\(\)](#), [kmminimalfamset\(\)](#), [kmsymmsetdiff\(\)](#), [kmtrivial](#)

**Examples**

```
kmsetiselement(c(1,1,1,0), xpl$space)
```

---

kmSF2basis

---

*DEPRECATED: kmSF2basis() has been replaced by kmbasis().*

---

### Description

DEPRECATED: kmSF2basis() has been replaced by kmbasis().

### Usage

```
kmSF2basis(x)
```

### Arguments

x                      Surmise function

### Value

Corresponding basis

### See Also

Other Deprecated functions and methods: [kmSR2basis\(\)](#), [kmSRdiagram\(\)](#), [kmbasisdiagram\(\)](#), [kmhasse\(\)](#)

---

kmsimulate

---

*Simulate a set of response patterns according to the BLIM*

---

### Description

kmsimulate returns a data set of n simulated response patterns based on the knowledge structure x given as a binary matrix. The simulation follows the BLIM (Basic Local Independence Model; see Doignon & Falmagne, 1999).

### Usage

```
kmsimulate(x, n, beta, eta)
```

### Arguments

x                      Binary matrix representing a knowledge space  
n                      Number of simulated response patterns  
beta                   Careless error probability value or vector  
eta                    Lucky guess probability value or vector

**Details**

The beta and eta parameters must be either single numericals or vectors with a length identical to the number of rows in the  $x$  matrix. A mixture is possible.

The sample function used by `kmsimulate` might work inaccurately for knowledge structures  $x$  with  $2^{31}$  or more states.

**Value**

Binary matrix representing the simulated data set

kmsimulate(xpl$space, 50, c(0.2, 0.25, 0.15, 0.2), c(0.1, 0.15, 0.05, 0.1))
kmsimulate(xpl$space, 50, c(0.2, 0.25, 0.15, 0.2), 0)
```

---

kmspace

kmspace *constructor method*

---

**Description**

`kmspace()` determines the knowledge space corresponding to a KST object

Please note that a knowledge space delineated by a surmise relation is quasi-ordinal. Therefore, the result is automatically marked as `kmqspace` object.

**Usage**

```
kmspace(x)

## S3 method for class 'kmdata'
kmspace(x)

## S3 method for class 'kmfamset'
kmspace(x)

## S3 method for class 'kmsurmisefunction'
kmspace(x)
```

```
## S3 method for class 'kmsurmiserection'
kmspace(x)
```

### Arguments

x                      KST object

### Value

Corresponding knowledge space

### See Also

Other Constructors: [kmfamset\(\)](#), [kmspace\(\)](#), [kmstructure\(\)](#)

Other Different representations for knowledge structures: [kmbasis\(\)](#), [kmsurmisefunction\(\)](#), [kmsurmiserection\(\)](#)

### Examples

```
kmspace(xpl$basis)
kmspace(xpl$sf)
```

---

kmSR2basis

*DEPRECATED: kmSR2basis() has been replaced by kmbasis().*

---

### Description

DEPRECATED: kmSR2basis() has been replaced by kmbasis().

### Usage

```
kmSR2basis(x)
```

### Arguments

x                      Surmise relation

### Value

Corresponding basis

### See Also

|              |                                                       |
|--------------|-------------------------------------------------------|
| kmSRvalidate | <i>Validate a surmise relation against a data set</i> |
|--------------|-------------------------------------------------------|

---

### Description

kmSRvalidate returns a list with two elements, Goodman & Kruskal's gamma value and the violational coefficient (VC).

### Usage

```
kmSRvalidate(data, sr)
```

### Arguments

|      |                                                       |
|------|-------------------------------------------------------|
| data | Binary matrix representing a set of response patterns |
| sr   | Binary matrix representing a surmise relation         |

### Value

A list with two elements:

**gamma** Goodman & Kruskal's gamma index

**vc** Violational Coefficient

**See Also**

```

---

kmstructure

---

Convert a binary matrix to a kmstructure object

---

**Description**

kmstructure() returns a kmstructure object after checking that the passed object is a binary matrix without double rows. The empty set and the full item set are added if missing.

**Usage**

```
kmstructure(x)
```

**Arguments**

x                      Binary matrix representing a family of sets

**Value**

kmstructure object

**See Also**

Other Constructors: [kmfamset\(\)](#), [kmqspace\(\)](#), [kmspace\(\)](#)

**Examples**

```
m <- matrix(c(1,0,0,0,1,0,1,1,1), nrow=3, byrow=TRUE)
kmstructure(m)
```

---

|                |                                                 |
|----------------|-------------------------------------------------|
| kmsubstructure | <i>Reduce a KST object to a subset of items</i> |
|----------------|-------------------------------------------------|

---

## Description

Reduce a KST object to a subset of items

## Usage

```
kmsubstructure(x, items)

## S3 method for class 'kmdata'
kmsubstructure(x, items)

## S3 method for class 'kmbasis'
kmsubstructure(x, items)

## S3 method for class 'kmstructure'
kmsubstructure(x, items)

## S3 method for class 'kmspace'
kmsubstructure(x, items)

## S3 method for class 'kmsurmiserection'
kmsubstructure(x, items)

## S3 method for class 'kmsurmisefunction'
kmsubstructure(x, items)
```

## Arguments

|       |                                                                      |
|-------|----------------------------------------------------------------------|
| x     | KST object                                                           |
| items | Selection of items (vector) to which the KST object shall be reduced |

## Value

Sub structure KST object (the kstMatrix class and its properties are preserved)

kmsubstructure() takes a KST object and determines a sub-structure based on the list of items.

The items can be specified through their item names or through the respective column numbers. At least two items must be specified.

|-------------------|--------------------------------------------------------------------|
| kmsurmisefunction | <i>Compute the surmise function for a knowledge space or basis</i> |
|-------------------|--------------------------------------------------------------------|

---

## Description

kmsurmisefunction returns a data frame representing the surmise function for a knowledge space or basis. The rows of the data frame are ordered by item name.

## Usage

```
kmsurmisefunction(x, itemname = "Item")
```

## Arguments

|          |                                                       |
|----------|-------------------------------------------------------|
| x        | Binary matrix representing a knowledge space or basis |
| itemname | Name for the first column of the resulting data frame |

## Value

Data frame representing the surmise unction of x.

## See Also

## Examples

```
kmsurmisefunction(xpl$space)
```

---

|                   |                                                                        |
|-------------------|------------------------------------------------------------------------|
| kmsurmiserelation | <i>Compute the surmise relation of a quasi-ordinal knowledge space</i> |
|-------------------|------------------------------------------------------------------------|

---

### Description

kmsurmiserelation returns a matrix representing the surmise relation of a quasi-ordinal knowledge space. If  $x$  is a general knowledge space, a knowledge structure or an arbitrary family of sets, kmsurmiserelation returns the surmise relation of the smallest quasi-ordinal knowledge space containing  $x$ .

### Usage

```
kmsurmiserelation(x)
```

### Arguments

$x$  Binary matrix representing a family of sets (class kmfamset)

### Value

Binary matrix representing the surmise relation

Note: The columns of the surmise relation matrix describe the minimal state for the respective item in the quasi-ordinal knowledge space.

### See Also

Other Different representations for knowledge structures: [kmbasis\(\)](#), [kmspace\(\)](#), [kmsurmisefunction\(\)](#)

### Examples

```
kmsurmiserelation(xpl$space)
```

---

|               |                                                              |
|---------------|--------------------------------------------------------------|
| kmsymmsetdiff | <i>Compute the symmetric set difference between two sets</i> |
|---------------|--------------------------------------------------------------|

---

### Description

Compute the symmetric set difference between two sets

### Usage

```
kmsymmsetdiff(x, y)
```

```
kmsetdistance(x, y)
```

**Arguments**

|   |                                  |
|---|----------------------------------|
| x | Binary vector representing a set |
| y | Binary vector representing a set |

**Value**

kmsymmsetdiff: Symmetric set difference between 'x' and 'y'

kmsetdistance: Distance between the sets 'x' and 'y', i.e. the cardinality of the symmetric set difference

**See Also**

Other Utilities: [binary\\_matrix\\_product\(\)](#), [kmdoubleequal\(\)](#), [kmminimalfamset\(\)](#), [kmsetiselement\(\)](#), [kmtrivial](#)

**Examples**

```
kmsymmsetdiff(c(1,0,0), c(1,1,0))
kmsetdistance(c(1,0,0), c(1,1,0))
```

---

|           |                                        |
|-----------|----------------------------------------|
| kmtrivial | <i>Create trivial knowledge spaces</i> |
|-----------|----------------------------------------|

---

**Description**

These functions create trivial knowledge spaces of a given item number. The minimal space contains just the empty set and the full item set while the maximal space is equal to the power set.

**Usage**

```
kmminimalspace(noi)
kmmaximalspace(noi)
```

**Arguments**

|     |                 |
|-----|-----------------|
| noi | Number of items |
|-----|-----------------|

**Details**

Please note that the computation time for creating large power sets can grow quite large easily.

**Value**

A binary matrix representing the respective knowledge space

**See Also**

Other Utilities: [binary\\_matrix\\_product\(\)](#), [kmdoubleequal\(\)](#), [kmminimalfamset\(\)](#), [kmsetiselement\(\)](#), [kmsymmsetdiff\(\)](#)

Other Functions for working with knowledge structures: [kmeqreduction\(\)](#), [kmexpand\(\)](#), [kmintersection\(\)](#), [kmmesh\(\)](#), [kmnotions\(\)](#), [kmsubstructure\(\)](#), [kmunion\(\)](#)

**Examples**

```
kmminimalspace(3)
kmmaximalspace(3)
```

---

kmunion

---

*Compute the "union" of two KST objects*

---

**Description**

Both objects must be of the same kstMatrix class, the result will be of the same class, i.e. a respective closure operator will be executed automatically.

**Usage**

```
kmunion(x, y)

## S3 method for class 'kmfamset'
kmunion(x, y)

## S3 method for class 'kmbasis'
kmunion(x, y)

## S3 method for class 'kmspace'
kmunion(x, y)

## S3 method for class 'kmstructure'
kmunion(x, y)

## S3 method for class 'kmsurmisefunction'
kmunion(x, y)

## S3 method for class 'kmsurmiserelation'
kmunion(x, y)
```

**Arguments**

|   |               |
|---|---------------|
| x | First object  |
| y | Second object |

**Details**

For surmise functions, the algorithm by Dowling & Hockemeyer (1998) is used.

Please note that, for families of sets, there are the functions `kmunionclosure()` and `kmintersectionclosure()`.

**Value**

*Union of x and y*

**References**

Dowling CE, Hockemeyer C (1998). “Computing the Intersection of Knowledge Spaces Using only their Basis.” In Dowling CE, Roberts FS, Theuns P (eds.), *Recent Progress in Mathematical Psychology*, 133–141. Lawrence Erlbaum Associates Ltd., Mahwah, NJ.

---

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| kmunionclosure | <i>Close a family of sets under union, i.e. determine the smallest knowledge space containing it</i> |
|----------------|------------------------------------------------------------------------------------------------------|

---

**Description**

Close a family of sets under union, i.e. determine the smallest knowledge space containing it

**Usage**

```
kmunionclosure(x)
```

**Arguments**

|   |               |
|---|---------------|
| x | Family of set |
|---|---------------|

**Value**

Knowledge space

`kmunionclosure` implements the irredundant algorithm developed by Dowling (1993).

**References**

Dowling, C. E. (1993). On the irredundant construction of knowledge spaces. *Journal of Mathematical Psychology*, 37, 49–62.

**See Also**

Other Closure operators: [kmclosure\(\)](#), [kmintersectionclosure\(\)](#)

**Examples**

```
kmunionclosure(xpl$basis)
```

---

kmvalidate

---

*Validate a knowledge structure against a data set*

---

**Description**

kmvalidate returns a list with three elements, a named vector (dist) with the frequencies of distances between a set of response patterns and a knowledge structure, the Discrepancy Index (DI), and the Distance Agreement Coefficient (DA).

**Usage**

```
kmvalidate(data, struct)
```

**Arguments**

|        |                                                       |
|--------|-------------------------------------------------------|
| data   | Binary matrix representing a set of response patterns |
| struct | Binary matrix representing a knowledge structure      |

**Value**

A list with three elements:

**dist** Distance distribution vector

**DI** Discrepancy Index

**DA** Distance Agreement Coefficient

**Warning**

The DA computation can take quite some time for larger item sets as the power set has to be computed. For item sets with around 30 items or more, it may even crash the system due to huge memory requests.

**See Also**

```

---

phsg

*Knowledge space on linear functions*

---

**Description**

Basis of a small knowledge space and list of items on linear functions used in a manuscript by Steiner et al.

**Usage**

phsg

**Format**

A list containing the basis and the list of items

---

plot

*Plot a Hasse diagram*

---

**Description**

plot draws a Hasse diagram for a family of sets or a surmise relation.

**Usage**

```
## S3 method for class 'kmfamset'

### Arguments

|                          |                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>x</code>           | Binary matrix representing a family of sets                                                                                                                                                           |
| <code>...</code>         | Optional inherited parameters                                                                                                                                                                         |
| <code>state</code>       | Knowledge state whose neighbourhood is to be pictured (Default 'NULL')<br>If state is NULL, the neighbourhood is depicted as a 'normal' family of sets (kmfamset) and a respective warning is issued. |
| <code>horizontal</code>  | Boolean defining orientation of the graph, default FALSE                                                                                                                                              |
| <code>colors</code>      | Color value or vector (default NULL).                                                                                                                                                                 |
| <code>keepNames</code>   | Keep item names (default TRUE)                                                                                                                                                                        |
| <code>itemsep</code>     | Item separator in sets (default ','; only for families of states)                                                                                                                                     |
| <code>braces</code>      | Put braces around vertices (default TRUE; only for families of states)                                                                                                                                |
| <code>vertexshape</code> | Shape of the vertex objects, e.g. circle, oval, box, or none. See <a href="#">Graphviz Node Shapes</a> for a complete list of possible values.                                                        |

|                |                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arrowhead      | Form of the arrow head, e.g. vee or none (default). See <a href="#">Graphviz Arrow Types</a> for a complete list of possible values. This may be used for vertical graphs although none is the standard there. |
| arrowtail      | Form of the arrow tail, e.g. vee or none (default). See <a href="#">Graphviz Arrow Types</a> for a complete list of possible values. This should be used for horizontal graphs.                                |
| edgelabel      | Boolean whether to label the edges of the diagram (default FALSE)                                                                                                                                              |
| verbose        | Verbosity level (0 (default), 1, or 2)                                                                                                                                                                         |
| structure      | Knowledge structure within which the path shall be depicted                                                                                                                                                    |
| pathcolors     | Colors for the individual learning paths                                                                                                                                                                       |
| pathcolor      | Colors for the individual learning paths (default: blue)                                                                                                                                                       |
| space          | Should basis or space be depicted? (default FALSE)                                                                                                                                                             |
| highlightcolor | Color for highlighting                                                                                                                                                                                         |

### Details

plot takes a matrix representing a family of sets (knowledge states) or a surmise relation and a color vector, and draws a Hasse diagram. If the color vector is NULL the states are drawn in green, the items in the relation are drawn in orange.

For a surmise relation, if there are equivalent items, they are contracted into one vertex labelled 'a ~ b ~ ...' for equivalent items a, b, ...

If the plot is to be used within a Shiny app, it must be included with `grVizOutput()` and `renderGrViz()` from the DiagrammeR package (`plotOutput()` and `renderPlot()` do not work).

Please note that, for equivalent items in a relation plot, the prerequisites are lost.

If the KST object to be plotted is a family of sets (`kmfamset`) **and** a state is specified, the colors vector must have four elements, (i) the color for the state, (ii) the color for its upper neighbours, (iii) the color for its lower neighbours, and (iv) the color for all other states.

### Examples

```
## Not run:
plot(phsg$basis)

sp <- kmunionclosure(phsg$basis)
n <- kmneighbourhood(phsg$basis[3,], sp, include=TRUE)
plot(n, state=phsg$basis[3,])

m <- matrix(c(1,0,0,1,1,1,1,1,1), ncol=3, byrow=FALSE)
class(m) <- unique(c("kmsurmiserelation", class(m)))
plot(m, vertexshape="oval")

## End(Not run)
```

readwrite

*Knowledge spaces on reading and writing abilities***Description**

Bases of knowledge spaces on reading/writing abilities obtained from querying experts.

**Usage**

```
readwrite
```

**Format**

A list containing four bases (rw1 to rw3, and rwmaj) in binary matrix form. Each matrix has 48 columns representing the different knowledge items and a varying number of rows containing the basis elements.

**Details**

Three experts were queried about prerequisite relationships between 48 items on reading and writing abilities (Dowling, 1991; 1993). A forth basis represents those prerequisite relationships on which the majority of the experts agree (Dowling & Hockemeyer, 1998).

xpl

*Small example knowledge space***Description**

Basis and space matrix, surmise relation and surmise function of a small fictional knowledge space, and two data sets (data (7 patterns) and sim (500 patterns)) to be used in examples. The latter was produced from the space with `kmsimulate()` with beta and eta values of 0.1.

**Usage**

```
xpl
```

**Format**

A list containing the basis, the space, the surmise relation, the surmise function, and the two data matrices data and sim.
