Package 'xutils'

October 14, 2022

Title Utility Functions of Fangzhou Xie

Version 0.0.2

Description This is a collection of some useful functions when dealing with text data.
Currently it only contains a very efficient function of decoding HTML entities
in character vectors by 'Rcpp' routine.

R topics documented:

`html_decode`	*Decode a character vector*

Description

This function is a wrapper around existing C++ code on decoding HTML entities. The original C++ code is given by Christoph. Please refer to the answer on SO here.

Usage

```
html_decode(str)
```

Arguments

str   A character vector

Value

Decoded character vector

Examples

```
html_decode(c("&amp;", "&euro;"))
```
